🎬 1️⃣ What Is Background Music (BGM)?

Background music (BGM) sets the **mood, emotion, and flow** of your video.

It's the *soul* of your visuals — even silent scenes feel alive with the right music.

🎧 **Purpose of BGM:**

Use	Description	Example
Emotion	Makes viewers *feel* something.	Sad piano → emotional scene
Energy	Keeps pace and excitement.	Fast beat → action vlog
Connection	Supports storytelling tone.	Soft strings → romantic moment
Flow	Fills silence and smooths transitions.	Ambient sound between scenes

---

🎵 2️⃣ Choosing the Right Music

Pick music that **matches your video's energy & story.**

Video Type	Music Type
Vlog / Travel	Upbeat, happy tunes
Cinematic Film	Orchestral, dramatic
Corporate Video	Clean, inspiring
Tutorials	Light, minimal background
Short Film	Emotional, soft or tension-based
Gaming / Edits	Bass-heavy, fast beats

🧠 **Tip:** Always ensure the music is *royalty-free* (from YouTube Audio Library, Mixkit, etc.).

🎧 3️⃣ How to Add Music in Premiere Pro

1️⃣ Import your audio track (MP3/WAV).

2️⃣ Drag it onto **Audio Track (A2 or A3)** below your video.

3️⃣ Adjust timing to match intro or mood.

4️⃣ Use **Razor Tool (C)** to trim unwanted parts.

5. Use Razor tools left click mixup the audio

🎚️ 4️⃣ Adjusting Music Volume

- Select the music clip.
- Open **Effect Controls → Volume → Level**.
- Adjust in decibels (dB):
  - Higher = louder
  - Lower = softer

🎯 **Ideal Audio Levels**

Type	dB Range
Dialogue / Voice	-6 dB to -3 dB
Music (under voice)	-18 dB to -12 dB
SFX / Hits	-12 dB to -6 dB

🎵 5️⃣ What Are Keyframes in Music?

Keyframes allow you to **control volume changes over time** — fade in, fade out, or smoothly lower background music during dialogue.

🔧 6️⃣ How to Add Keyframes to Music

🎚️ Method 1: Using Effect Controls

1. Select your music clip.
2. Go to **Effect Controls → Volume → Level.**
3. Click the **stopwatch icon** (this enables keyframing).

4. Move the playhead → change the volume → Premiere auto adds another keyframe.

🎵 Example:

- At start → Volume **∞ dB**
- After 2 seconds → Volume **6 dB** (creates a fade-in)

🎚️ Method 2: Directly on Timeline

1. Expand the audio track.
2. Hold **Ctrl (Cmd on Mac)** and click the yellow volume line → adds keyframes.
3. Drag keyframes up/down to control volume.

🎯 **Use:** Perfect for quick fade-ins and fade-outs.

🎬 7️⃣ Common Keyframe Animations for Music

Effect	What It Does	How to Create
Fade In	Music starts softly and builds	0 dB → slowly raise volume
Fade Out	Music gently disappears	Gradually reduce volume
Duck Under Dialogue	Lowers music when voice starts	Keyframe down during speech
Beat Emphasis	Raise volume slightly on beats	Small volume lifts on drops
Transition Sync	Match music change with cut	Move keyframes to align with visual change

---

🪄 8️⃣ Pro Techniques for Smooth Audio

1️⃣ Ease In / Ease Out Keyframes

→ Right-click keyframe → “Ease In” or “Ease Out” for natural fade.

2️⃣ Crossfade Between Two Music Clips

→ Use *Exponential Fade* effect (Audio Transitions → Crossfade).

3️⃣ **Audio Ducking (Automatic)**

→ Select music → Essential Sound → Set as “Music” → Enable *Auto Ducking*.

Premiere automatically lowers music under dialogue!

4️⃣ **Use EQ (Equalizer)**

→ Cut low frequencies if voice sounds muddy.

→ Effect: *Multiband Compressor / Parametric Equalizer*.

5️⃣ **Add Reverb or Echo**

→ Gives cinematic, wide feel.

→ Effect: *Studio Reverb* → Adjust Dry/Wet balance.

🧠 9️⃣ Smart Tips

✅ Always normalize your audio before final export.

✅ Keep dialogue clear — music should *support*, not overpower.

✅ Align beats with visual cuts for rhythm.

✅ Avoid sudden volume jumps — keyframe smoothly.

✅ Preview in headphones for perfect balance.

✅ Keep audio tracks labeled:

- A1 = Voice
- A2 = Music
- A3 = SFX

💥 1️⃣0️⃣ Quick Remember Formula

🎙️ Voice = Story

🎧 SFX = Realism

🎵 Music = Emotion

🎚️ Keyframes = Control
